Sacramento, CA 95821

Dear Rey Ortega,

The egg testing of the donut sample that we received Tuesday, January 15, 2008 has been completed. The result is listed below.

<u>Sample I.D.</u>	<u>Egg</u>
11-15, Donuts-Glazed	BLD*

BLD\* Below the limit of detection. The lower limit of detection of the Neogen Veratox® Quantitative Egg Allergen Test (specific for egg white) is 2.5 parts per million (ppm). Amounts below this level cannot be reliably detected with this assay. One ppm is equivalent to one milligram of egg per kilogram of sample product.

**IMPORTANT NOTE:** If the possible source of allergen contamination in your samples is from fermentation, or consists of fermented or hydrolyzed materials, current test methods cannot measure allergen levels appropriately in these cases. This can result in a severe underestimate of the allergen content of your samples. In these special cases, a BLD reading may be indicated but there still could be enough allergenic residues left over to be capable of causing an allergic reaction. If your sample is of this type, please contact the FARRP laboratory at 402-472-4484 for further assistance.

Please contact Dr. Steve Taylor at 402-472-2833 or via email at [staylor2@unl.edu](mailto:staylor2@unl.edu) if you have any questions regarding this analysis.

Sincerely,

Sean Kraft  
Research Technologist
